

# Introduction to Programming

# What is programming?

- ✓ You give a set of instructions to the computer
- ✓ The computer executes all instructions in a specific order
  - There should be enough information for the computer to decide what to do in all situations
  - These instructions or steps are called a program or code
  - Does computer understand English? —> No
    - Programming language — Binary 0101010
    - 100011001100

Set of instructions (Thinking)

Tu Tam Aad → You

# Programming Lang

Real world  
Languages

Machine  
Code

- ① Coming up with instructions
- ② Converting these into prog lang

# Some Issues !!

- What if you don't give the instructions correctly?
- What if some instruction fails? *while running (runtime error)*
- What if even after correct execution you get wrong result? *(logical error)*
- What if it takes too long to complete the instructions? *(time limit exceeded)*
- What if it takes too many resources to complete the instructions? *exceeded*
- What if the instructions don't follow a syntax?

*memory limit exceeded*

*first multiply 8*

$$2 + (2 \times 3)$$

*first add*

$$12$$

$$4 / (4 - 4) \text{ --- runtime error}$$

---

$$(2 + 2) \times 3 \# \text{ ---}$$

$$(2) + (2 \times 3) \text{ ==}$$

0 1 2 3 4 5 7 8 9 10 11 12 13

Time      complexity       $\leq N$   $N$

More memory / resources

lower time

moment

$\propto$

$\frac{1}{\text{time}}$

---

# Programming Language

- Why so many programming languages?
- Does it matter which one you learn first?
- How easy it is to switch between languages?

C++ > Java > Python

✓

↑

# Competitive Programming

- Many people competing to
  - Write the code that gets executed fastest (within a threshold)
  - Write the code that uses minimum resources
  - Do this faster than others
- How is it different from normal programming?
- Best programming language CP
  - C++
- How is competitive programming useful?

$[1 \quad 2 \quad 3 \quad 4 \quad 5 \quad \dots \quad 10^9]$

6      100    120
